CS 161 Fundamentals of Artificial Intelligence Lecture 10

First-order Logic: Inference

Quanquan Gu

Department of Computer Science UCLA

March 3, 2022

Teaching/Course Evaluation

- The online evaluations has opened 8:00 AM today, March 3 and will close 8:00 AM Saturday, March 12.
- Your feedback are valuable and more than welcome!
- Students who have done the online evaluation will receive 1 extra point in the final grade:)

Outline

- ▶ Reducing first-order inference to propositional inference
- Unification
- Generalized Modus Ponens
- Resolution

Universal Instantiation (UI)

- Mhenever a KB contains a universally quantified sentence, we may add to the KB any instantiation of that sentence, where the logic variable v is replaced by a concrete ground term g:
- For any variable v and ground term g, we denote substitution θ as $\theta = \{v/g\}$, $\mathrm{SUBST}(\theta, \alpha)$ as the result of applying the substitution θ to the sentence α .
- Every instantiation of a universally quantified sentence is entailed by it:

$$\frac{\forall v \ \alpha}{\text{SUBST}(\{v/g\}, \alpha)}$$

E.g.,
$$\forall x \; King(x) \land Greedy(x) \Rightarrow Evil(x) \; \text{yields}$$

$$King(John) \land Greedy(John) \Rightarrow Evil(John)$$

$$King(Richard) \land Greedy(Richard) \Rightarrow Evil(Richard)$$

$$King(Father(John)) \land Greedy(Father(John))$$

$$\Rightarrow Evil(Father(John))$$

Existential Instantiation (EI)

Whenever a KB contains an existentially quantified sentence $\exists v \ \alpha$, we may add a single instantiation of that sentence to the KB, where the logic variable v is replaced by a **Skolem constant** symbol k which must not appear elsewhere in the knowledge base:

$$\frac{\exists v \ \alpha}{\text{Subst}(\{v/k\}, \alpha)}$$

• Ex1, $\exists x \ Crown(x) \land OnHead(x, John)$ yields

$$Crown(C_1) \wedge OnHead(C_1, John)$$

provided C_1 is a new constant symbol, called a **Skolem constant**

• Ex2: from $\exists x \ d(x^y)/dy = x^y$ we obtain

$$d(e^y)/dy = e^y$$

provided e is a new constant symbol

Reduction to propositional inference

- ► Instantiating all quantified sentences allows us to ground the KB, that is, to make the KB propositional
- Suppose the KB contains just the following:

```
\forall x \ King(x) \land Greedy(x) \Rightarrow Evil(x)

King(John)

Greedy(John)

Brother(Richard, John)
```

Instantiating the universal sentence in all possible ways, we have

```
King(John) \wedge Greedy(John) \Rightarrow Evil(John)

King(Richard) \wedge Greedy(Richard) \Rightarrow Evil(Richard)

King(John) Greedy(John)

Brother(Richard, John)
```

► The new KB is **propositionalized**: proposition symbols are

```
King(John),\ Greedy(John),\ Evil(John),King(Richard)\ {\tt etc.}
```

Reduction contd.

- Every FOL KB can be propositionalized so as to preserve entailment
- ► Then, FOL inference can be done by: propositionalize KB and query, apply resolution, return result
- ▶ Problem: with function symbols, there are infinitely many ground terms Father(Father(Father(John)))

Theorem: Herbrand (1930). If a sentence α is entailed by an FOL KB, it is entailed by a **finite** subset of the propositional KB

- For n=0 to ∞ do
 - \triangleright create a propositional KB by instantiating with depth-n terms
 - ightharpoonup see if α is entailed by this KB
- ▶ Works if α is entailed, loops if α is not entailed!

Theorem: Turing (1936), Church (1936), entailment in FOL is semidecidable –that is, algorithms exist that say yes to every entailed sentence, but no algorithm exists that also says no to every nonentailed sentence

Problems with propositionalization

• Propositionalization seems to generate lots of irrelevant sentences.

E.g., from

```
\forall x \ King(x) \land Greedy(x) \Rightarrow Evil(x)

King(John)

\forall y \ Greedy(y)

Brother(Richard, John)
```

- ullet It seems obvious that Evil(John), but propositionalization produces lots of facts such as Greedy(Richard) that are irrelevant
- ullet With p k-ary predicates and n constants, there are $p \cdot n^k$ instantiations
- With function symbols, it gets much worse!

- ▶ Instead of instantiating quantified sentences in all possible ways, we can compute specific substitutions "that make sense". These are substitutions that unify abstract sentences so that rules can be applied.
- ▶ Unification: finding substitutions that make different logical expressions look identical. UNIFY $(\alpha, \beta) = \theta$ if SUBST $(\theta, \alpha) = \text{SUBST}(\theta, \beta)$
- Suppose we want to know: whom does John know?
- Answers to this query can be found by finding all sentences in the knowledge base that unify with Knows(John, x).

α	β	θ
Knows(John, x)	Knows(John, Jane)	$\{x/Jane\}$
Knows(John, x)	Knows(y, OJ)	
Knows(John, x)	Knows(y, Mom(y))	
Knows(John, x)	Knows(x, OJ)	
Knows(John, x)	$Knows(x_{17}, OJ)$	

- ► Instead of instantiating quantified sentences in all possible ways, we can compute specific substitutions "that make sense". These are substitutions that unify abstract sentences so that rules can be applied.
- ▶ Unification: finding substitutions that make different logical expressions look identical. UNIFY $(\alpha, \beta) = \theta$ if SUBST $(\theta, \alpha) = \text{SUBST}(\theta, \beta)$
- Suppose we want to know: whom does John know?
- Answers to this query can be found by finding all sentences in the knowledge base that unify with Knows(John, x).

α	β	$\mid heta \mid$
Knows(John, x)	Knows(John, Jane)	$\{x/Jane\}$
Knows(John, x)	Knows(y, OJ)	$\{x/OJ, y/John\}$
Knows(John, x)	Knows(y, Mom(y))	
Knows(John, x)	Knows(x, OJ)	
Knows(John, x)	$Knows(x_{17}, OJ)$	

- ▶ Instead of instantiating quantified sentences in all possible ways, we can compute specific substitutions "that make sense". These are substitutions that unify abstract sentences so that rules can be applied.
- ▶ Unification: finding substitutions that make different logical expressions look identical. UNIFY $(\alpha, \beta) = \theta$ if SUBST $(\theta, \alpha) = \text{SUBST}(\theta, \beta)$
- Suppose we want to know: whom does John know?
- Answers to this query can be found by finding all sentences in the knowledge base that unify with Knows(John, x).

α	β	$\mid \theta \mid$
Knows(John, x)	Knows(John, Jane)	$\{x/Jane\}$
Knows(John, x)	Knows(y, OJ)	$\{x/OJ, y/John\}$
Knows(John, x)	Knows(y, Mom(y))	$\{y/John, x/Mom(John)\}$
Knows(John, x)	Knows(x, OJ)	
Knows(John, x)	$Knows(x_{17}, OJ)$	

- ▶ Instead of instantiating quantified sentences in all possible ways, we can compute specific substitutions "that make sense". These are substitutions that unify abstract sentences so that rules can be applied.
- ▶ Unification: finding substitutions that make different logical expressions look identical. UNIFY $(\alpha, \beta) = \theta$ if SUBST $(\theta, \alpha) = \text{SUBST}(\theta, \beta)$
- Suppose we want to know: whom does John know?
- Answers to this query can be found by finding all sentences in the knowledge base that unify with Knows(John, x).

α	β	$\mid heta \mid$
$\overline{Knows(John,x)}$	Knows(John, Jane)	$\{x/Jane\}$
Knows(John, x)	Knows(y, OJ)	$\{x/OJ, y/John\}$
Knows(John, x)	Knows(y, Mom(y))	$\{y/John, x/Mom(John)\}$
Knows(John, x)	Knows(x, OJ)	$\int fail$
Knows(John, x)	$Knows(x_{17}, OJ)$	

- Instead of instantiating quantified sentences in all possible ways, we can compute specific substitutions "that make sense". These are substitutions that unify abstract sentences so that rules can be applied.
- ▶ Unification: finding substitutions that make different logical expressions look identical. UNIFY $(\alpha, \beta) = \theta$ if SUBST $(\theta, \alpha) = \text{SUBST}(\theta, \beta)$
- Suppose we want to know: whom does John know?
- Answers to this query can be found by finding all sentences in the knowledge base that unify with Knows(John,x).

α	β	$\mid heta \mid$
Knows(John, x)	Knows(John, Jane)	$\{x/Jane\}$
Knows(John, x)	Knows(y, OJ)	$\{x/OJ, y/John\}$
Knows(John, x)	Knows(y, Mom(y))	$\{y/John, x/Mom(John)\}$
Knows(John, x)	Knows(x, OJ)	fail
Knows(John, x)	$Knows(x_{17}, OJ)$	$\{x/OJ, x_{17}/John\}$

Standardizing Apart

α	β	θ
$\overline{Knows(John,x)}$	Knows(x, OJ)	fail
Knows(John, x)	$Knows(x_{17}, OJ)$	$\{x/OJ, x_{17}/John\}$

- ► First unification fails: the problem arises only because the two sentences happen to use the same variable name *x*
- ► The problem can be avoided by standardizing apart one of the two sentences being unified, which means renaming its variables to avoid name clashes.

Standardizing apart eliminates overlap of variables, e.g., Knows(x,OJ) to $Knows(x_{17},OJ)$

Most General Unifier

- ▶ UNIFY (α, β) returns a substitution that makes α, β look the same
- Maybe more than one unifier! e.g., $\text{UNIFY}(Knows(John,x),Knows(y,z)) \text{ could return } \{y/John,x/z\} \text{ or } \{y/John,x/John,z/John\}; \text{ first one more general!}$
- ► For every unifiable pair of sentences, there is a single most general unifier (MGU) that is unique up to renaming and substitution of variables.
- For UNIFY(Knows(John, x), Knows(y, z)), the MGU is $\{y/John, x/z\}$.

Generalized Modus Ponens (GMP)

For atomic sentences p_i, p_i', q , where there is a substitution θ such that $\forall i, \mathsf{SUBST}(\theta, p_i') = \mathsf{SUBST}(\theta, p_i)$, then

$$\frac{p_1', p_2', \dots, p_n', (p_1 \land p_2 \land \dots \land p_n \Rightarrow q)}{\mathsf{SUBST}(\theta, q)}$$

For example,

$$\begin{array}{lll} p_1' \text{ is } King(John) & p_1 \text{ is } King(x) \\ p_2' \text{ is } Greedy(y) & p_2 \text{ is } Greedy(x) \\ \theta \text{ is } \{x/John, y/John\} & q \text{ is } Evil(x) \\ \text{SUBST}(\theta,q) \text{ is } Evil(John) \end{array}$$

GMP: definite clauses

- GMP used with KB of definite clauses:
- Definite clauses:
 - Atomic sentences
 - Implication whose premises is a conjunction of positive literals and whose conclusions is a single positive literal.
 - All variables assumed universally quantified
 - Examples:
 - ightharpoonup King(John)
 - $ightharpoonup King(x) \wedge Greedy(x) \Rightarrow Evil(x)$
- Comparison: Horn clauses in propositional logic!
 - Proposition symbol
 - ▶ (conjunction of symbols) ⇒ symbol
 - Examples:
 - **>** C
 - $ightharpoonup A \wedge B \Rightarrow C$

Soundness of GMP

GMP is a sound inference rule! (only derives entailed sentences)

We want to show that

$${p_1}',\;\ldots,\;{p_n}',\;\;(p_1\wedge\ldots\wedge p_n\Rightarrow q)\models\mathsf{SUBST}(\theta,q)$$

provided that $SUBST(\theta, p_i') = SUBST(\theta, p_i)$ for all i

- ▶ First, for any definite clause p, we have $p \models \mathsf{SUBST}(\theta, p)$
- ightharpoonup Second, from p_1', \ldots, p_n' , we can infer

$$SUBST(\theta, p'_1) \land \ldots \land SUBST(\theta, p'_n)$$
 (1)

▶ Third, from $(p_1 \land \ldots \land p_n \Rightarrow q)$, we can infer

$$SUBST(\theta, p_1) \land ... \land SUBST(\theta, p_n) \Rightarrow SUBST(\theta, q)$$
 (2)

▶ Finally, since θ satisfies that SUBST $(\theta, p_i') = \text{SUBST}(\theta, p_i)$, by (1) and (2), we have SUBST (θ, q)

Conversion to CNF

- Every sentence of first-order logic can be converted into an inferentially equivalent CNF sentence (it is satisfiable exactly when the original sentence is satisfiable)
- Example: Everyone who loves all animals is loved by someone:
- $\forall x \ [\forall y \ Animal(y) \Rightarrow Loves(x,y)] \Rightarrow [\exists y \ Loves(y,x)]$
- 1. Eliminate biconditionals and implications

$$\forall x \ [\neg \forall y \ \neg Animal(y) \lor Loves(x,y)] \lor [\exists y \ Loves(y,x)]$$

2. Move \neg inwards: $\neg \forall x, p \equiv \exists x \neg p$, $\neg \exists x, p \equiv \forall x \neg p$:

$$\forall x \ [\exists y \ \neg(\neg Animal(y) \lor Loves(x,y))] \lor [\exists y \ Loves(y,x)] \\ \forall x \ [\exists y \ \neg\neg Animal(y) \land \neg Loves(x,y)] \lor [\exists y \ Loves(y,x)] \\ \forall x \ [\exists y \ Animal(y) \land \neg Loves(x,y)] \lor [\exists y \ Loves(y,x)]$$

Conversion to CNF contd.

3. Standardize apart variables: each quantifier should use a different variable

$$\forall x \ [\exists y \ Animal(y) \land \neg Loves(x,y)] \lor [\exists z \ Loves(z,x)]$$

4. Skolemize: a more general form of existential instantiation. Each existential variable is replaced by a **Skolem function** of the enclosing universally quantified variables:

$$\forall x \ [Animal(F(x)) \land \neg Loves(x, F(x))] \lor Loves(G(x), x)$$

5. Drop universal quantifiers:

$$[Animal(F(x)) \land \neg Loves(x, F(x))] \lor Loves(G(x), x)$$

6. Distribute ∧ over ∨:

$$[Animal(F(x)) \lor Loves(G(x), x)] \land [\neg Loves(x, F(x)) \lor Loves(G(x), x)]$$

Resolution: brief summary

Full first-order version:

$$\frac{\ell_1 \vee \dots \vee \ell_k, \quad m_1 \vee \dots \vee m_n}{\mathsf{SUBST}(\theta, (\dots \vee \ell_{i-1} \vee \ell_{i+1} \vee \dots \vee m_{j-1} \vee m_{j+1} \vee \dots))}$$

where $UNIFY(\ell_i, \neg m_j) = \theta$.

Note Unify(α, β) = θ if SUBST(θ, α) = SUBST(θ, β) For example,

- $[Animal(F(x)) \lor Loves(G(x), x)] \text{ and } \\ [\neg Loves(u, v) \lor \neg Kills(u, v)]$
- ▶ We could eliminate Loves(G(x),x) and $\neg Loves(u,v)$ with unifier $\theta = \{u/G(x),v/x\}$ to produce the resolvent clause $Animal(F(x)) \lor \neg Kills(G(x),x)$

Example knowledge base

Example: build a knowledge base!

The law says that it is a crime for an American to sell weapons to hostile nations. The country Nono, an enemy of America, has some missiles, and all of its missiles were sold to it by Colonel West, who is American.

Prove that Colonel West is a criminal

... it is a crime for an American to sell weapons to hostile nations:

... it is a crime for an American to sell weapons to hostile nations:

 $American(x) \wedge Weapon(y) \wedge Sells(x,y,z) \wedge \\$

 $Hostile(z) \Rightarrow Criminal(x)$

Nono ... has some missiles

```
... it is a crime for an American to sell weapons to hostile nations:  American(x) \wedge Weapon(y) \wedge Sells(x,y,z) \wedge \\ Hostile(z) \Rightarrow Criminal(x) \\ \text{Nono ... has some missiles, i.e.,} \\ \exists x \ Owns(Nono,x) \wedge Missile(x): \\ Owns(Nono,M_1) \ \text{and} \ Missile(M_1) \\ \text{... all of its missiles were sold to it by Colonel West}
```

```
... it is a crime for an American to sell weapons to hostile nations: American(x) \wedge Weapon(y) \wedge Sells(x,y,z) \wedge \\ Hostile(z) \Rightarrow Criminal(x) \\ \text{Nono ... has some missiles, i.e.,} \\ \exists x \ Owns(Nono,x) \wedge Missile(x): \\ Owns(Nono,M_1) \text{ and } Missile(M_1) \\ \text{... all of its missiles were sold to it by Colonel West} \\ \forall x \ Missile(x) \wedge Owns(Nono,x) \Rightarrow Sells(West,x,Nono) \\ \text{Missiles are weapons:}
```

```
... it is a crime for an American to sell weapons to hostile nations:
 American(x) \wedge Weapon(y) \wedge Sells(x, y, z) \wedge
Hostile(z) \Rightarrow Criminal(x)
Nono ... has some missiles, i.e.,
\exists x \ Owns(Nono, x) \land Missile(x):
 Owns(Nono, M_1) and Missile(M_1)
... all of its missiles were sold to it by Colonel West
 \forall x \; Missile(x) \land Owns(Nono, x) \Rightarrow Sells(West, x, Nono)
Missiles are weapons:
 Missile(x) \Rightarrow Weapon(x)
An enemy of America counts as "hostile":
```

```
... it is a crime for an American to sell weapons to hostile nations:
 American(x) \wedge Weapon(y) \wedge Sells(x, y, z) \wedge
Hostile(z) \Rightarrow Criminal(x)
Nono ... has some missiles, i.e.,
\exists x \ Owns(Nono, x) \land Missile(x):
 Owns(Nono, M_1) and Missile(M_1)
... all of its missiles were sold to it by Colonel West
 \forall x \; Missile(x) \land Owns(Nono, x) \Rightarrow Sells(West, x, Nono)
Missiles are weapons:
 Missile(x) \Rightarrow Weapon(x)
An enemy of America counts as "hostile":
 Enemy(x, America) \Rightarrow Hostile(x)
West, who is American . . .
 American(West)
The country Nono, an enemy of America ...
 Enemy(Nono, America)
```

Resolution example: West is criminal

Transfer FOL into CNF

- ► $American(x) \land Weapon(y) \land Sells(x, y, z) \land Hostile(z) \Rightarrow Criminal(x)$
 - $ightharpoonup \neg American(x) \lor \neg Weapon(y) \lor \neg Sells(x,y,z) \lor \neg Hostile(z) \lor Criminal(x)$
- $ightharpoonup \forall x \; Missile(x) \land Owns(Nono, x) \Rightarrow Sells(West, x, Nono)$
 - $\qquad \neg Missile(x) \lor \neg Owns(Nono,x) \lor Sells(West,x,Nono) \\$
- $ightharpoonup Missile(x) \Rightarrow Weapon(x)$
 - $ightharpoonup \neg Missile(x) \lor Weapon(x)$
- **.**..

Resolution example: West is criminal

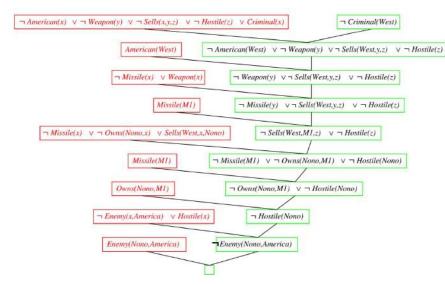

We have the following knowledge base(KB):

- $\neg American(x) \lor \neg Weapon(y) \lor \neg Sells(x,y,z) \lor \neg Hostile(z) \lor Criminal(x)$
- $ightharpoonup \neg Missile(x) \lor \neg Owns(Nono, x) \lor Sells(West, x, Nono)$
- ightharpoonup $\neg Enemy(x, America) \lor Hostile(x)$
- $ightharpoonup \neg Missile(x) \lor Weapon(x)$
- $ightharpoonup Owns(Nono, M_1)$
- ightharpoonup American(West)
- $ightharpoonup Missile(M_1)$
- ightharpoonup Enemy(Nono, America)

We want to prove Criminal(West)

- ▶ Apply resolution steps to $CNF(KB \land \neg \alpha)$
- ▶ Show $KB \land \neg Criminal(West)$ is unsatisfiable!

Resolution example: West is criminal

Summary

- ▶ Reducing first-order inference to propositional inference
- Unification
- Generalized Modus Ponens
- Resolution
